Project Summary

CodeColosseum is a web-based competitive programming platform that allows users to solve algorithmic problems, participate in one versus one ranked matches or timed contests, and track their progress through a rating system. The platform supports multiple programming languages and evaluates submitted solutions automatically by executing them against predefined & user defined test cases within an isolated sandbox environment. Users are assigned a rating score that evolves based on their contest performance.

The system is designed around two core user roles: contestants who submit solutions and compete and administrators who oversee the platform, schedule contests, and moderate community-submitted problems through an approval workflow. CodeColosseum aims to provide a fair, scalable, and engaging environment.
